According to my understanding, the so-called “dark phase of photosynthesis” depends on the light phase because it depends on substances that are produced Dark-phase light contamination can significantly disrupt chronobiologic rhythms, thereby potentially altering the endocrine physiology and metabolism of The light phase of photosynthesis takes place on the thylakoid membrane. The dark phase of photosynthesis takes place in the stroma. Photosynthesis at the Origin of Life. The dark phase of photosynthesis has nothing to do with dark. This process can take place even in the presence of light, but does not necessarily require light. Light energy, carbon dioxide and water are used to produce sugar (glucose) and release oxygen. While sunlight is used during the light reactions to produce ATP and the electron carrier NADPH, the dark reactions use these products to complete photosynthesis independent of light - 5 min - Uploaded by CM Lowry This screencast explains how light is transducer into neural signals.
